UI/UX ASSIGNMENT - 1

Aim :- To design a user friendly cosmetics and skincare app that helps users find products suited to their needs

PROBLEM STATEMENT :- Online cosmetics & skincare shopping can be confusing due to wide variety. Users often struggle to identify suitable products.

GLO with tagline "Find what Fits You", aims to simplify this experience. It introduces a 'Beauty match questionnaire' that collects users prefrences and presents relevant product recommendations with match percentages and explations.

PROPOSED SOLUTION :- GLO provides a guided shopping experience through a Beauty match questionnaire, personalised product results and comparison that helps users make informed choices.

CONCLUSION :-
This project focuses on making cosmetics & skincare shopping more personalised, transparent & convinient through an effective UI/UX design.

UIUX Assignment - 2.

AIM :- Research and Planning.

INTRODUCTION :- In beauty shopping, users have different preferences, budgets, skin concerns, etc, therefore, finding appropriate products can become time-consuming.

The GLO project focuses on improving product discovery and helping users make decisions. The main features include :-

i) Product Discovery : Allows users to explore more.
ii) Beauty Match Questionnaire : Collects user preferences
iii) Personalised Results : Displays relevant products with match percentages.
iv) Product Details : Presents info such as prices, ingredients and ratings.
v) Product comparison : Helps users evaluate alternatives side by side.

USER JOURNEYS :-

Home → Beauty Match Questionnaire → Personalised Results → Product Details → Product comparison.

Conclusion :- The research and planning stage establishes the design requirements for GLO.

UIUX Assignment - 03.

Aim :- Low - fidelity Wireframes.

INTRODUCTION :- Low fidelity wireframes are basic layouts that represent structure of an app without detailed colours, typography.

Wireframe Design :-

- Home - Screen : Provides access to product discovery & Beauty match feature.
- Beauty Match Questionnaire : Allows users to select their preferences
- Comparison Screen : Organises product attributes for easier evaluation.

Benefits :- Wireframes provide a clear structural reference for Hifi design.

Conclusion :- The Lo-Fi wireframes establis the basic structures of UIUX & connect its main features into a logical user journey.

UIUX - 04.

AIM :- High Fidelity Design in Figma.

INTRO :- This represents final visual appearance including colour, icons, images.

UI/UX :- Design should maintain consistency, hierarchy. The Home screen should provide easy access to product discovery. Important information should be easy to identify without making the interface crowded.

CONCLUSION :- It develops basic wireframs into polished representation of UI. It focuses on presenting personalised recommendations and product info.

MMX ASS - 05.

AIM :- NIELSEN'S PRINCIPLES.

THEORY :- Heuristic eval is a usability inspection method used to identify problems in an interface.
The app should provide clear feedback when users complete Beauty Match questionnaire or retrieve recommendations.
Interface should also prevent errors, and help find relevant product info.

CONCLUSION :- Nielsen's principles help identify potential usability prob in GUI. Applying them can improve navigation, user control, resulting in better beauty shopping experience.

UI/UX - 06

AIM :- MAZE TESTING.

THEORY :- A Figma prototype can be imported into Maze, where tasks are created.

For GLO,

- Locate and complete Beauty Match Questionnaire
- View personalised product recommendations
- Find product details.
- Identify why a product matches
- Compare products.

CONCLUSION :-

Usability testing helps designers understand how to interact. Maze can help evaluate GLO's navigation and product - discovery experience, and identify improvements. Actual testing results should be recorded

UIUX - 07.

AIM :- ACCESSIBLE & INCLUSIVE DESIGN

PROBLEM STATEMENT :- Users with special needs may experience difficulty using interfaces

THEORY :-

Accessible design ensures that digital products can be used by people with different abilities.

- Visual accessibility
- Hearing accessibility
- Motor accessibility

CONCLUSION :-

Applying accessibility principle can make UI/UX easier to use for people.

FAQ's.

1. Explain 4 principles of WCAG.

→ Perceivable means information must be accesible.

→ Operable means interface controls must be usable

→ Understandable means actions should be clear
